5. [7 points] Another one of Kiki's time machines called Machine2 can send a 1kg notebook $y = r(E) = 2 \log(E) - 3$ years into the past or future when it consumes $E$ megawatt-hours (MWh) of energy.

a. [3 points] How much energy is required for the Machine2 to send a 1 kg notebook 5 years into the future? Be sure to show your work and give your answer in exact form with units. 

_________________________ of energy is required.

b. [4 points] Kiki has noticed that if she triples the energy input of Machine2, the number of years a 1 kg notebook travels in time increases by a fixed amount (that is not dependent on $E$). Find the amount of increase of $r(E)$ when $E$ is tripled. Give your answer in exact form. Only solutions that show the amount of increase is not dependent on $E$ will receive full credit.

$r(E)$ increases by ______________________ when $E$ is tripled.
