## 7. [4 points]

Find all possible solutions $w$ to the equation $\frac{2 e^{9(w-1)}}{7}=3$. Be sure to show all your steps, give your answer in exact form, and circle your final answer.

Solution: We can multiply both sides by $\frac{7}{2}$ to get

$$
e^{9(w-1)}=\frac{21}{2}
$$

Taking ln of both sides then gives

$$
9(w-1)=\ln \left(\frac{21}{2}\right)=\ln (21)-\ln (2)
$$

and solving for $w$, we get

$$
w=\frac{\ln (21)-\ln (2))}{9}+1
$$

8. [5 points]

Consider the function

$$
R(q)=\frac{5 q+3}{4-q}
$$

Find a formula for its inverse. Be sure to show all your steps, and circle your final answer.
Solution: If we let $W=R(q)$, then we can set

$$
W=\frac{5 q+3}{4-q}
$$

Solving for $q$ in terms of $W$, we get

$$
W(4-q)=5 q+3
$$

Putting all the $q$ terms to the same side gives

$$
5 q+W q=4 W-3
$$

And using that $5 q+W q=q(5+W)$, we divide to get

$$
q=\frac{4 W-3}{5+W}
$$

Hence our function for the inverse should be

$$
R^{-1}(W)=\frac{4 W-3}{5+W}
$$
