4. [6 points] A rational function $h(x)$ has zeros at $x = -1, 0, 2$, vertical asymptotes at $x = 1, 3$, and a horizontal asymptote at $y = -2$. Find a possible formula for $h(x)$. You do not need to show your work, but you may receive credit for correct work shown. There are many correct answers, and you can leave your answer unsimplified.

$$h(x) = \frac{-2(x+1)(x-2)}{(x-1)(x-3)^2}$$

Solution: There are lots of possible right answers. The important components are that $x$, $(x+1)$, $(x-2)$ appears as factors in the numerator (and not in the denominator), that $(x-1)$ and $(x-3)$ appear as factors in the denominator (and not in the numerator, or if they appear in the numerator they appear with a higher power in the denominator), that the numerator and denominator have the same degree and that the ratio of the leading coefficients is -2.

5. [5 points] The graph of the function $r(x) = \frac{x-1}{2x}$ is a transformation of the graph of the function $m(x) = \frac{1}{x}$. Fill in the following blanks with the transformations needed to transform the graph of $m(x)$ into the graph of $r(x)$. On each line use one of the phrases given below for the first blank and a number for the second blank, if applicable (for reflections, do not use the second blank). Be sure to list the transformations in the proper order. You may not need to use all four lines below, so just leave any unused lines blank.

<table>
<thead>
<tr>
<th>Shift it horizontally to the right</th>
<th>Shift it horizontally to the left</th>
<th>Shift it vertically upwards</th>
<th>Shift it vertically downwards</th>
<th>Reflect it over the y-axis</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compress it horizontally</td>
<td>Stretch it horizontally</td>
<td>Compress it vertically</td>
<td>Stretch it vertically</td>
<td>Reflect it over the x-axis</td>
</tr>
</tbody>
</table>

To get the graph of $r(x)$ starting with the graph of $m(x)$,

first, we __compress it horizontally__ by __1/2__ ,

and then we __reflect it over the x-axis__ by ____________ ,

and then we __shift it vertically upwards__ by __1/2__ ,

Solution: Note that there are many possible correct answers. The key is writing the function as $r(x) = \frac{1}{2} - \frac{1}{2x}$.
