

10. (10 points) The figure below gives the graph of the derivative  $f'$  of a function  $f$

- (a) On what interval(s) is  $f$  increasing?

The function  $f$  is increasing for  $x < 3$ .  $\left[ \begin{array}{l} \text{or} \\ -6 < x < 3 \end{array} \right]$

- (b) On what interval(s) is  $f$  concave down?

The function is concave down when  $f'$  is decreasing  
 -- i.e. for  $x < -2.5$  and for  $1 < x < 5$ .  $\left[ \begin{array}{l} \text{or} \\ -6 < x < -2.5 \\ \text{and} \\ 1 < x < 5 \end{array} \right]$

- (c) For what value of  $x$  (approximately) is  $f(x)$  the largest? Explain.

The function is increasing until  $x=3$  & then decreases, thus,  $f$  has its largest value @  $x=3$ .

- (d) For what value of  $x$  (approximately) is  $f''(x)$  the largest? Explain.

The second derivative,  $f''$  would be largest when the slope of  $f'$  (or a tangent to  $f'$ ) is steepest in a positive direction. This appears to be around  $x \approx -1$ . (see graph)
