

3. [5 points] The function  $y(t)$ , given to the right, gives the mass, in milligrams, of a yeast colony  $t$  hours after an experiment begins, where  $A$ ,  $B$ , and  $C$  are constants.

$$y(t) = \begin{cases} \frac{A}{1 + e^{-Ct}} & 0 \leq t < 4 \\ 12B^t & t \geq 4 \end{cases}$$

Find the values of  $A$ ,  $B$ , and  $C$  such that all of the following hold:

- $\lim_{t \rightarrow 0^+} y(t) = 8$ ,
- the yeast colony's mass decays by 2% each hour after  $t = 4$ , and
- $y(t)$  is continuous at  $t = 4$ .

Show your work, and give your answers in **exact form**.

*Solution:* Because  $\frac{A}{1+e^{-Ct}}$  is a continuous function, the first point gives

$$8 = \lim_{t \rightarrow 0^+} \frac{A}{1 + e^{-Ct}} = \frac{A}{1 + e^{-C \cdot 0}} = \frac{A}{1 + 1},$$

so  $A = 16$ . The second point gives  $B = 0.98$ .

Finally, the third point means we must have  $\lim_{t \rightarrow 4^-} y(t) = \lim_{t \rightarrow 4^+} y(t) = y(4)$ . So we must have

$$\frac{16}{1 + e^{-C \cdot 4}} = 12 \cdot (0.98)^4 \quad \text{so} \quad \frac{16}{12 \cdot (0.98)^4} - 1 = e^{-C \cdot 4}.$$

Taking  $\ln$  of both sides and then dividing by  $-4$ , we get  $C = -\frac{1}{4} \ln \left( \frac{16}{12 \cdot (0.98)^4} - 1 \right)$ .

**Answers:**  $A =$  16  $B =$  0.98  $C =$   $-\frac{1}{4} \ln \left( \frac{16}{12 \cdot (0.98)^4} - 1 \right)$

4. [7 points] Consider the rational function  $r(x) = \frac{x(x-1)(x+4)^2}{(x^2-1)(x+4)}$ .

a. [5 points]

- i. Find the equations of any horizontal asymptotes of  $r(x)$  or write NONE if there are none.

**Answer:** NONE

- ii. Find all the zeros of  $r(x)$ , or write NONE if there are none.

**Answer:** 0

- iii. Find all numbers  $c$  such that the limit  $\lim_{x \rightarrow c} r(x)$  exists but  $r(c)$  is *not* defined.

**Answer:** -4, 1

- b. [2 points] Find a linear function  $h(x)$  such that the function  $r(x) \cdot h(x)$  has no vertical asymptotes.

**Answer:**  $h(x) =$   $x + 1$
