5. [8 points] The amount of power produced by a wind turbine depends on the speed of the wind. In particular, suppose $P(s)$ is the power, in megajoules per hour (MJ/h), produced by the turbine when the speed of the wind is $s$ kilometers per hour $(\mathrm{km} / \mathrm{h})$. Also suppose that $W(t)$ gives the wind speed, in $\mathrm{km} / \mathrm{h}$, at the turbine's location $t$ hours after noon on a certain day.

Assume that $P(s)$ is invertible, and that both $P(s)$ and $W(t)$ are differentiable.
a. [2 points] Use a complete sentence to give a practical interpretation of the equation

$$
P(W(0))=8 .
$$

Solution: At noon, the turbine produces $8 \mathrm{MJ} / \mathrm{h}$ of power.
b. [3 points] Complete the following sentence to give a practical interpretation of the equation

$$
W^{\prime}(4)=18 .
$$

From 4:00pm to 4:10pm, ...
Solution: the wind speed at the turbine's location increases by approximately $3 \mathrm{~km} / \mathrm{h}$.
c. [3 points] Circle the one statement below that is best supported by the equation

$$
\left(P^{-1}\right)^{\prime}(13)=2.9 .
$$

i. When the turbine is generating $13 \mathrm{MJ} / \mathrm{h}$ of power, an increase of one $\mathrm{km} / \mathrm{h}$ in wind speed will produce approximately $2.9 \mathrm{MJ} / \mathrm{h}$ more power.
ii. If the turbine is producing $13 \mathrm{MJ} / \mathrm{h}$ of power, the wind speed must increase by approximately $2.9 \mathrm{~km} / \mathrm{h}$ to produce an additional $M J / h$ of power.
iii. If the wind is blowing at $13 \mathrm{~km} / \mathrm{h}$ and increases to $14 \mathrm{~km} / \mathrm{h}$, the power produced by the turbine will increase by about $2.9 \mathrm{MJ} / \mathrm{h}$.
$i v$. If the wind speed is $13 \mathrm{~km} / \mathrm{h}$, the power generation of the turbine will increase by one $\mathrm{MJ} / \mathrm{h}$ if the wind speed increases to about $15.9 \mathrm{~km} / \mathrm{h}$.
