

1. (2 points each) True or False. Circle True only if the statement is always true.

- (a) If f' is increasing, then f is increasing. T F
- (b) If f is an exponential function, then $\frac{d}{dx} \ln f(x)$ is constant. T F
- (c) If $f''(x) = 0$ for all x , then f is a constant function. T F
- (d) There is a function f so that $f(x) > 0$, $f'(x) < 0$, and $f''(x) < 0$ for all x . T F
- (e) If $f''(x) < 0$ for all x , then $f(x) \leq f(0) + f'(0)x$ T F
- (f) If $f'(x) = 0$, then f has either a relative maximum or relative minimum at x . T F

2. (7 points) The function g has a continuous derivative whose values are given in the following table. There is no more than one critical point of g between any two consecutive x -values in the table.

Note that the table gives values of $g'(x)$, NOT $g(x)$.

x	0	1	2	3	4	5	6	7	8	9	10
$g'(x)$	-9	-2	2	1	-1	-3	-6	-5	-4	2	10

(a) Estimate the x -coordinates of the critical points of g for $0 < x < 10$.

$$1 < x < 2 \quad \text{or} \quad x \approx 1.5$$

$$3 < x < 4 \quad \text{or} \quad x \approx 3.5$$

$$8 < x < 9 \quad \text{or} \quad x \approx 8.5$$

(b) For each critical point found in part (a), determine if it corresponds to a local maximum or minimum of the function g . Be sure to explain.

For $x \approx 1.5$, there is a local min because g decreases to the left of the CP and increases to the right.

For $x \approx 3.5$, there is a local max because g increases to the left of the CP + increases to the right.

For $x \approx 8.5$, there is a local min since g decreases to the left of the CP + increases to the right.
