6. [10 points] The Green Bag Company (GBC) makes hand bags out of recycled materials. A table of the company's marginal cost, $M C$, and marginal revenue, $M R$, at various production levels $q$ is given below. The variable $q$ is the number of hand bags produced, and marginal cost and marginal revenue are measured in dollars per bag.

| $q$ | 1000 | 2000 | 3000 | 4000 | 5000 | 6000 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $M C$ | 100 | 81 | 75 | 96 | 112 | 123 |
| $M R$ | 125 | 123 | 114 | 110 | 107 | 106 |

Assume for this problem that GBC's cost and revenue functions are twice differentiable and that $M C$ and $M R$ are either increasing or decreasing on each interval shown in the table.
a. [3 points] At which production level from the table is GBC's profit increasing the fastest? Explain your answer.
b. [3 points] The CEO of the company thinks profit is maximized at 3000 bags, but the CFO of the company thinks that profit will be maximized at 4500 bags. Who could be correct, and why? [Note: The terms "CEO" and "CFO" refer to officers in the company.]
c. [4 points] Assuming GBC has no fixed costs, use a right-hand sum to estimate the cost to produce the first 3000 bags. Be sure to show your work.
