- 1. (3 pts each) Circle true or false. No explanation necessary.
  - (a) If 0 < f(x) < g(x) for all x, then  $\int_{1}^{4} \frac{g(x)}{f(x)} > 3$ .

True 
$$\int_{1}^{4} \frac{g(x)}{f(x)} dx > \int_{1}^{4} \frac{f(x)}{f(x)} dx = \int_{1}^{4} 1 dx = x|_{1}^{4} = 4 - 1 = 3.$$

(b)  $\int_{\pi}^{\pi} \frac{\sin^2(x^5) - \cos(42x)}{x^2 + x + 1} > 2.$  False The integral is from  $\pi$  to  $\pi$ , so it's 0.

(c)  $\int_{1}^{\infty} \frac{1}{x^{71}} dx$  converges.

True 
$$\int_{1}^{\infty} \frac{1}{x^{71}} dx = \lim_{b \to \infty} \int_{1}^{b} x^{-71} dx = \lim_{b \to \infty} \left. -\frac{1}{70} x^{-70} \right|_{1}^{b} = \lim_{b \to \infty} \left. -\frac{1}{70b^{70}} + \frac{1}{70} = \frac{1}{70}.$$

- (d) If g(x) + 2 is an antiderivative of f(x), then g(x) is also an antiderivative of f(x). True g(x) + 2 and g(x) have the same derivative.
- 2. (6 pts) State the construction theorem for antiderivatives.

If f(x) is continuous on the closed interval [a,b], then the function  $F(x)=\int_a^x f(t)\,dt$  is an antiderivative of f(x) for  $a\leq x\leq b$ .
