8. [14 points] Let $g(x)$ be a differentiable function with domain $(-1,10)$ where some values of $g(x)$ and $g^{\prime}(x)$ are given in the table below. Assume that all local extrema and critical points of $g(x)$ occur at points given in the table.

| $x$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $g(x)$ | 2.0 | 3.3 | 5.7 | 6.8 | 6.0 | 4.3 | 2.4 | 0.2 | -4.9 |
| $g^{\prime}(x)$ | 2.8 | 2.5 | 2.0 | 0.0 | -1.4 | -1.9 | -1.6 | -3.0 | -8.1 |

a. [3 points] Estimate $\int_{0}^{8} g(x) d x$ using RIGHT(4). Write out each term in your sum.
b. [4 points] Approximate the area of the region between $g(x)$ and the function $f(x)=x+2$ for $0 \leq x \leq 4$, using $\operatorname{MID}(n)$ to estimate any integrals you use. Use the greatest number of subintervals possible, and write out each term in your sums.
c. [3 points] Is your answer to $\mathbf{b}$. an overestimate, an underestimate, or is there not enough information to tell? Briefly justify your answer.
Answer: (circle one)
NOT ENOUGH INFORMATION
d. [4 points] Write an integral giving the arc length of $y=g(x)$ between $x=2$ and $x=8$. Estimate this integral using TRAP(2). Write out each term in your sum.

Answer: Integral: $\qquad$

Answer: $\operatorname{TRAP}(2)=$ $\qquad$
